2. Building an effective scheme of relationships with suppliers

3. In the supply chain, each organization buys material resources from previous suppliers, adds value to them and sells them to the next customers.

Thus, material resources move further along the supply chain, and each purchase becomes an impetus to continue this movement.

Relevance of the topic. Purchasing is one of the main elements of a company's business. Reducing the costs associated with the purchase of materials and services allows the company to increase its profitability. At the same time, a decrease in the quality of purchased products is not allowed.

This means that it is necessary to select qualified suppliers, to form stable and mutually beneficial partnerships with them. Thanks to this, the company can reduce procurement risks.

Procurement logistics is the activity of managing material flows in the process of supplying an enterprise with material resources: raw materials, materials, components, goods.

She is engaged in organizing all types of activities related to obtaining material resources and services from suppliers: purchase, delivery, acceptance, temporary storage of material resources, etc.

The new business environment required a change in views on the essence and content of the main methods of enterprise management, with the introduction of quality management systems into everyday practice to ensure that reasonable consumer requirements for product quality are met.

An essential element of any enterprise's "quality management systems" system is procurement quality. These include: raw materials, materials, components, third-party services, etc.

Purchasing is one of the main elements of increasing profit margins, minimizing working capital, optimizing the supply chain and ensuring the quality of products or services provided by any enterprise.

In this regard, the quality management system must ensure the quality of procurement as a continuous and stable process of acquisition, delivery and rational use of the necessary material resources that meet the quantity, quality and delivery time established by the requirements.
